Purpose

San Joaquin Council of Governments (SJCOG) requires a long-range demographic and employment forecast to support the development of its Regional Transportation Plan (RTP), and Sustainable Communities Strategy (SCS). SJCOG updates these forecasts at approximately five-year intervals with the most recent update occurring in 2021. Cities and other agencies within the County also use the forecast to inform their own local planning efforts such as general plans and municipal service reviews. The forecast focuses on three areas: population, households, and employment. Population forecasts are broken down by age, race and ethnicity, and this detailed population forecast is used to generate the household projection.

At the county level, detailed population and employment forecasts are generated using REMI (Regional Economic Models, Inc.), a widely used regional modeling software model which captures the complex interdependence of demographic and economic factors. The county-level population forecasts are broken down by age, race, and ethnicity, and the employment forecasts are made at the industry level. The first section focuses on the county-level forecasts, including descriptions of the models used and forecasting assumptions. The second section details the results for sub-county areas and explains the process and adjustments used to allocate the county-level forecast to local areas.

Section One: County Forecast

The economic and demographic forecasts were created using REMI. The REMI model is an econometric regional forecasting model. One of the strongest features of the REMI model is its integrated dynamic feedback between economic and demographic variables. For this forecasting exercise, the key feedback relationship is between local employment conditions and the migration of households in and out of the region. The REMI model is used by many metropolitan planning organizations for this purpose, most notably the Bay Area's Metropolitan Transportation Commission and Association of Bay Area Governments (MTC-ABAG), so using the REMI model aligns SJCOG's forecasting approach with other agencies in the region.

The REMI model uses historical data from several government sources to estimate economic and demographic forecast predictions at national and regional levels.¹ The model first makes projections at the national level and subsequently uses the national results to produce regional forecasts. REMI PI+ provides a default forecast, based on the current national and regional data available to conduct robust and dynamic regression estimators. While REMI provides an initial baseline forecast, another strength of the model is the ability of users to update and adjust the forecast and see the effect of alternative future scenarios. As described below, we incorporate

¹ REMI is primarily based on data released by key federal statistical agencies, the Bureau of Economic Analysis (BEA), Bureau of Labor Statistics (BLS), and the U.S. Census Bureau (Census). For a detailed description of all the historical data used in the REMI model, see "REMI PI+ v3.2 Major Economic Data Sources." https://www.remi.com/wp-content/uploads/2024/08/Model-Overview-v3_2.pdf.

several sources of recent data and make additional adjustments based on knowledge of the local economy to capture trends and future developments.

The forecast presented in this report utilizes REMI PI+ v3.2.0, which was released in May 2024. It is a 27-region, 70-industry model of the U.S. and California economy in which San Joaquin County is defined as a unique region in California. The historical data is current through 2022, the latest year for which Bureau of Economic Analysis (BEA) personal income and other key economic data is available, and the model forecast period runs from 2025 to 2050. The REMI model allows for users to update and benchmark the model to 2023 and 2024 data when available, as well as to customize the forecast to include known future events and user judgement about local conditions.

The rest of this section is organized as follows. First, a review of the baseline REMI forecast results is presented to establish the model's initial predictions. Next, a list of updates and adjustments made to the model to more accurately project San Joaquin County demographic and employment profile into the future are detailed. The sections that follow present and discuss the results of the updated population forecast, and then use the population forecast to generate a projection of households and housing needs to accommodate the household growth. The last part of this section presents the updated employment by industry forecast for the county.

1.1 – REMI Baseline Forecast

The REMI model is delivered with an initial forecast for San Joaquin County based on the model's analysis of historical data through 2022 and an assumed long-range U.S. macroeconomic forecast. This is sometimes referred to as the “out of the box” or default REMI forecast, but we use the term REMI baseline forecast in this report. Examining the results of the baseline forecast gives a point of comparison for adjustments and allows us to understand some of the important drivers in the REMI model for San Joaquin County before we add updated data and the impact of some significant projects and plans expected in the near future.

As shown in Figure 1, the baseline forecast for San Joaquin County in the REMI model shows consistent employment growth throughout the forecast horizon. Annual growth of 0.6% predominates between 2025 and 2050. The REMI model's optimism stems from San Joaquin County's heavy dependence on industries, such as transportation and warehousing, that recently experienced significant employment growth. In the REMI model, migration of households in and out of counties is highly sensitive to local job opportunities. Thus, over time, the model also predicts employment growth in San Joaquin will also lead to an increase in these economic migrants to San Joaquin County, resulting in higher population growth.

Figure 1 – REMI Baseline Employment Forecast for San Joaquin County

Figure 2 shows the REMI baseline population forecast for San Joaquin County, and to provide perspective it also shows the latest population forecast from the California Department of Finance (DOF).² Following the pattern seen in the REMI baseline employment forecast, the REMI baseline population forecast shows relatively robust population growth throughout the forecast horizon. As a result, San Joaquin County’s population growth is projected to be higher than the DOF forecast. In the following sections, we explain how we update the population forecast to incorporate the most recent data and assumptions about the longer-term employment dynamic. Again, as we update employment forecasts, those impacts carry through to the population forecast through changes in migration. Another source of updates to the baseline population forecast comes from adjustments in “amenity value,” which affects the county’s population by reflecting its comparative inter-regional attractiveness that results in more economic migrants entering the region annually. In the next section, we describe a series of adjustments that we have made to REMI model based on more current data, local experience, and knowledge of upcoming development plans.

² The California DOF forecast shown here was released in March 2024, known as Vintage 2023.

Figure 2 – REMI Baseline and CA DOF Population Forecasts 2024-2050

1.2 – Updates and Adjustments to the REMI Baseline Model

To generate the final county-wide forecast, a series of data updates and adjustments, identified below, were made to the REMI baseline model. After the data adjustments described below were made, the REMI model was employed to generate a new solution to account for all the linkages and feedback effects among the variables within the model. The first adjustments were updates to employment and population data to reflect the latest available local data. Finally, we made some adjustments to account for the county’s amenity value as a result of inter-regional and broader remote work considerations.

This section describes a series of updates and adjustments made to the REMI baseline model. These fall into four general categories: COVID-19 adjustments to the macroeconomic forecast, updating 2019 employment data to match recent data releases, local employment forecast to account for the pandemic-induced recession that began in March 2020, and adjustments to account for several large projects under development in San Joaquin County.

Employment Data Update

Data from the Bureau of Labor Statistics (BLS) was used to update employment levels for each industry to their 2023 annual value. REMI uses the Bureau of Economic Analysis (BEA) definition of employment, which includes both employees and the self-employed (i.e., 1099), whereas BLS data sources focus on payroll (i.e., W-2) jobs only. Thus, the BLS data could not be directly entered into REMI, but we adjusted the percent change in employment between 2022 and 2023 for each industry in REMI to match the percent change in industry employment from the BLS data. We utilized Quarterly Census of Employment and Wages (QCEW) data to make the 2023 update a highly accurate data set based on tax filings.

Population Data Update

Like many areas in California, San Joaquin County has experienced a slowing of population growth in recent years. According to BEA's county population estimates, annual average population growth (2020-2023) was 0.9% in the 2020s. That contrasts with annual average population growth of 1.3% in the 2010s, 2.1% in the 2000s, and 1.7% in the 1990s. The U.S. Census Bureau's midyear population estimates serve as the basis for the BEA estimates. However, the BEA has produced intercensal annual county population statistics for 2010 to 2019, aligned with the Census Bureau's decennial counts from 2010 and 2020. The BEA developed these intercensal statistics because the necessary data was not available when the Census Bureau released county population figures for 2020 to 2023, which are derived from the 2020 decennial counts. To generate these intercensal figures, BEA employed a modified version of the Census Bureau's Das Gupta method,³ adjusted to account for the extra day in a leap year. Thus, using this BEA data to update San Joaquin County's 2022 and 2023 population estimates led to a reduction in the county's population growth compared to the Baseline Model.

Amenity Value Adjustment

Even though moderated by recent updated employment and population data, strong pre-pandemic job and population growth rates result in San Joaquin County having an unrealistically enhanced level of attractiveness and investment potential that results in enhanced effects on economic migration to the region. In the REMI model, these influences are reflected through a variable called amenity value. Therefore, we adjusted the county's amenity value to account for this recency bias. This reduction slows migration to more realistic contemporary levels and smooths out the path of migration over time – reducing it in the medium-term but paralleling longer-term dynamics as shown previously in Figure 2.

1.3 – Updated Population Forecast

After making the adjustments described in section 1.2, the REMI model was re-run to generate an updated forecast. Figure 3 shows this REMI Adjusted Forecast compared to the REMI Baseline Forecast and the California Department of Finance (DOF) forecast for San Joaquin

³ For details on the U.S. Census Bureau Das Gupta estimation method, see <https://www2.census.gov/programs-surveys/popest/technical-documentation/methodology/intercensal/2000-2010-intercensal-estimates-methodology.pdf>.

County released in 2024.⁴ The updated forecast (REMI Adjusted) is slightly lower than the REMI Baseline by the late 2020s, but over time tracks closer to the DOF forecast than the REMI Baseline. As discussed in the previous section, the moderate reduction in population growth is due to our adjustments to the regional amenity variable as well as updates to population and employment values. In the long-run, the adjustments we have made result in projected county-wide total population levels between the REMI Baseline and the CA DOF forecasts.

Figure 3 – Population Forecast Comparison: CA DOF, REMI Adjusted & Baseline Model

Table 1 shows the detailed total of San Joaquin County population in the updated forecast for each year through 2050. The forecast shows the remaining years of the 2020s will be peak years for San Joaquin County population growth with total county population growth of about 8,500 per year, around 1.1% annually. This is a slight increase over the 0.9% annual average population growth experienced from 2020 to 2023. After 2029, population growth is forecast to slowly decline to 0.7% annually by where it will remain for the rest of the forecast. San Joaquin County's population is projected to exceed 950,000 in 2049.

⁴ California Department of Finance Vintage 2023 population forecast, Table P-2A, released March 8, 2024. Available at <https://www.dof.ca.gov/forecasting/demographics/Projections/>.

Table 1 – San Joaquin County Population, Updated Forecast.

Year	Total Population	Annual Change	Annual % Change
2025	804,252	13,074	1.7%
2026	813,954	9,702	1.2%
2027	821,035	7,082	0.9%
2028	827,671	6,635	0.8%
2029	833,916	6,245	0.8%
2030	839,888	5,972	0.7%
2031	845,607	5,720	0.7%
2032	851,279	5,671	0.7%
2033	856,786	5,508	0.6%
2034	862,143	5,356	0.6%
2035	867,518	5,375	0.6%
2036	873,226	5,709	0.7%
2037	878,799	5,573	0.6%
2038	884,301	5,502	0.6%
2039	889,854	5,553	0.6%
2040	895,516	5,662	0.6%
2041	901,263	5,747	0.6%
2042	907,063	5,800	0.6%
2043	912,975	5,912	0.7%
2044	919,039	6,065	0.7%
2045	925,241	6,201	0.7%
2046	931,509	6,269	0.7%
2047	937,611	6,101	0.7%
2048	943,774	6,163	0.7%
2049	950,019	6,245	0.7%
2050	956,344	6,325	0.7%

Tables 2 and 3 break down the updated population forecast by race, ethnicity and age. Table 2 illustrates that the Hispanic population exceeds half of total San Joaquin County population by 2050, and is projected to grow faster than any other racial or ethnic group from about 350,000 in 2025 to 480,000 by 2050. The White Non-Hispanic population is projected to slowly decline from 211,000 in 2025 to about 180,000 in 2050. The Black Non-Hispanic population is projected to grow slowly from 56,000 in 2025 to 62,000 in 2050, while the Other Non-Hispanic⁵ category will grow from about 185,000 in 2025 to nearly 232,000 in 2050.

Table 3 shows how San Joaquin County's population will grow older over time. The 65+ age range increases by 65% between 2025 and 2050, from 115,000 in 2025 to 191,000 in 2050. In

⁵ The REMI model has only 4 groups for race and ethnicity. The Other category is primarily Asian but includes all non-Hispanic individuals who are not identified as Black or White.

contrast, the under 25 population is projected to decline by 4% between 2025 and 2050, from 282,000 in 2025 to 272,000 in 2050. Within that population, the young adult population (15 to 24 years of age) will contract from 120,000 in 2025 to 108,000 in 2050, a 10% decline. The working age population (25 to 64 years of age) will grow from 407,000 in 2025 to 494,000 in 2050.

Table 2 – San Joaquin County Population Forecast - Race Breakdown

	Hispanic	White-non-Hispanic	Black-non-Hispanic	Other-non-Hispanic	All Races
2025	353,232	210,530	55,684	184,806	804,252
2030	380,324	206,636	57,275	195,653	839,888
2035	405,107	200,140	58,312	203,959	867,518
2040	430,551	193,162	59,296	212,508	895,516
2045	456,465	186,467	60,378	221,930	925,241
2050	482,322	180,406	61,598	232,019	956,344
Change 2025-2050	129,090	-30,125	5,914	47,212	152,092
% Change 2025-2050	37%	-14%	11%	26%	19%

Table 3 – San Joaquin County Population Forecast – Age Breakdown

	Ages 0-14	Ages 15-24	Ages 25-64	Ages 65+	All Ages
2025	162,283	119,949	406,565	115,456	804,252
2030	155,971	121,471	427,006	135,439	839,888

% Change 2025-2050	1%	-10%	21%	65%	19%

1.4 – Updated Household Forecast

The Household forecast uses the population projections from the Adjusted REMI Model to calculate the number of householders in San Joaquin County. It is important to note that there is a distinction between a household and householder, though their numerical values are equivalent. The term householder refers to the person, or one of the people, in whose name the home is owned, being bought, or rented. Whereas a household consists of all the people who occupy a housing unit as their usual place of residence. Following standard practice, we forecast the number of households by projecting the number of householders.

The number of householders is estimated using the U.S. Census Bureau’s American Community Survey, 5-Year Estimates, to obtain the householders demographic characteristics: race, age cohorts, and sex. Using this data, we calculate the probability that an individual of a particular sex, race and age is likely to be a householder, and the corresponding probabilities are applied to

the demographic population estimates in the updated population forecast described in the previous section. The householder probabilities were estimated using the average values from the 2022 five-year Census ACS data. This data is available as far back as the 2006-2010 ACS, and the trend towards lower rates of household formation, particularly among the 25-34-year age group, is clear. Thus, by only using the most recent data for householder rates, we are assuming the trend seen in the more recent data, with lower levels of household formation among young adults, will continue into the future. The householder estimates are equivalent to the number of occupied housing units (or households).

Figure 4 shows the household forecast for San Joaquin County. Overall, households grow at a similar rate as population with slight differences as the demographic composition of the population changes over time. The County is estimated to have about 245,000 households in 2025, which grows to over 290,000 households by 2050.

Figure 4 – CBPR San Joaquin County Householder Forecast – based on Adjusted Forecast

The household forecast is closely related to San Joaquin County’s total housing need, defined as the number of housing units required to house the County’s projected households. Over a decade ago, following the construction boom driven by the housing bubble and during the height of the foreclosure crisis, San Joaquin County faced an oversupply of housing units and historically high vacancy rates. Those excess housing units have largely been absorbed by the market and the county-wide vacancy rate has subsequently declined. This is illustrated by Figure 5 which shows

the vacancy rate for San Joaquin County housing units based on One-Year Census American Community Survey from 2014 to 2024. Housing unit vacancies were over 8% in 2014 but has declined in subsequent years as the growth in new households has exceeded construction of new housing units and in 2023 the vacancy rate was down to 5.3%.

Figure 5 – San Joaquin County Housing Vacancy Rate

The need for future housing production in the County can be derived from the household forecast. Planners often use a 5% vacancy rate for the amount of vacancy that a typical housing market without many second homes requires to accommodate turnover and renovation of existing units. Tourist areas and some urban centers will often have higher vacancy rates, because they are popular locations for second homes that have only occasional use. That is not the case for San Joaquin County, so we estimate future housing needs at the level of new units required to accommodate projected households and maintain a 5% market vacancy rate. As described in the previous paragraph, San Joaquin County is currently near a 5% vacancy rate. Thus, our estimate of future housing need does not account for any excess housing that the market needs to absorb, or any catch-up production if the market is currently in shortage. We simply add a 5% margin to the number of projected new households in each year to estimate the annual housing need at the County level.

Figures 6 shows the estimated annual housing need for San Joaquin County, and Figure 7 shows the cumulative amount of housing units needed from 2025 forward to 2050. Housing needs are greatest in the immediate future with over 4,000 units needed in 2025. The annual housing need declines to about 1,700 units by 2033 and remains in a range between 1,700 and 2,000 units through the rest of the forecast to 2050. The cumulative housing need forecast provides another useful perspective. As shown in Figure 7, we estimate San Joaquin County needs about 27,000 units over the next decade. Recent housing production trends suggest that San Joaquin County is unlikely to produce 4,000 units needed at the beginning of the forecast. The forecast of cumulative needs provides a way to track if San Joaquin County is keeping up with its goals over time.

Figure 6 – San Joaquin County Annual Housing Needs Forecast

Figure 7 – San Joaquin County Cumulative Housing Needs Forecast

1.5 – Updated Employment Forecast

Figure 8 shows the Adjusted Forecast for employment in San Joaquin County. Compared to the REMI Baseline Model, this forecast is slightly more pessimistic regarding the county’s future employment growth with annual projected employment lower by between 3,960 and 4,970. Despite this, total employment levels are forecast to grow by 0.7% through the first half of the 2030s and throughout the rest of the forecast horizon average about 0.6% annually.

Figure 8 – San Joaquin County Updated Employment Forecast

Table 4 shows the employment forecast by industry. Recent growth in Transportation and Warehousing is projected to continue with a further 20,000 jobs between 2025 and 2050. Despite this increase of 32.5%, our adjusted employment forecast is well below the 69.2% increase the sector experienced between 2015 and 2020 when the e-commerce boom led by Amazon increased employment from 26,000 to 44,000 jobs. Healthcare is another industry with significant employment growth in the forecast, adding about 14,000 jobs over the next 25 years. Most other industries are projecting very modest growth, including Construction with employment expected to increase by about 4,800 jobs over the next 25 years.

Table 4 – Adjusted Forecast: Employment by Industry 2015-2050

Industry	2025	2030	2035	2040	2045	2050	Change 2025-2050	% Change 2025-2050
Agriculture	17,558	17,417	17,370	17,371	17,302	17,229	-329	-1.9%
Mining	204	203	202	197	193	189	-15	-7.2%

Section Two: Local Area Forecast

In this section, the county-level forecast for population, householders and employment is presented for the local geographies of cities and unincorporated areas. The REMI Adjusted forecasts in Section One are presented at the county level and this is the smallest geography available for the REMI model. Therefore, we break down the county-level forecast to local areas using trend growth in available local data, with adjustments for consideration of local market factors and plans after consultation with local officials. More details on this process and the results are in the sub-sections that follow.

In Section 2.1, the definitions for the local and sub-county areas are presented. Section 2.2 describes the data and methodology used to break out the county-level forecast into the local areas. Section 2.3 describes the results for population, householders, and employment. Detailed tables of employment by industry for each of the local areas are included in Appendix A.

2.1 – Geography

The forecast was broken down into 11 local areas, including the eight incorporated cities in San Joaquin County: Escalon, Lathrop, Lodi, Manteca, Mountain House,⁶ Ripon, Stockton and Tracy. For the other four local areas, the unincorporated area of San Joaquin County was broken down into three sub-areas using U.S. Census County Subdivisions (CCDs). Given the available data and geography of San Joaquin County, this approach was determined to be best of the feasible options for forecasting unincorporated areas.

The U.S. Census Bureau (Census) breaks the entire county into nine CCDs. As shown in Figure 9, we aggregated these into three regions: East, Northwest, and Southwest. The East region consists of the Escalon, Linden-Farmington, and Lockeford CCDs; the Northwest region consists of the Lodi, Stockton, and Thornton CCDs; and the Southwest region consists of the Manteca, Ripon, and Tracy CCDs. To create data for the unincorporated area within these three regions, we subtracted the data values for incorporated cities from the County Subdivision totals in each of the three regions. This results in the three unincorporated zones illustrated in Figure 9: Unincorporated East, Unincorporated Northwest, and Unincorporated Southwest. In addition to representing different regional characteristics, this specific configuration was necessary to avoid data problems that arise when the boundaries of incorporated cities overlap the boundaries of the CCDs, a significant problem for the City of Lathrop because it includes portions of both the Manteca and Tracy CCDs both of which are consolidated into the Unincorporated Southwest region.

⁶ Owing to the recent incorporation of Mountain House on July 1, 2024, historic data for the jurisdiction is not available. Therefore, the Mountain House Census Designated Place (CDP) was used throughout the sub-county forecasting process as a proxy for the city.

Figure 9 – San Joaquin County Geographic Regions

2.2 – Local Area Forecast Data and Methodology

Forecasts for the local areas followed a two-step process. In the first step, we gathered the best available local level data on population, households, and employment and used a trend analysis to forecast each local area's share of the County total in future years. This generated an initial forecast for each variable that was shared with local jurisdictions. In the second step, we consulted with local officials for feedback on the initial forecasts and discussed recent developments, future plans, and local market trends.

Local Area Population and Households: Methodology for initial forecast

The county-level population forecasts described in Section One above, along with population data from the 2010 and 2020 Decennial Census, were utilized to create the local projections.⁷ The local forecast used this Census data to estimate growth rate for each area. The 2010 to 2020 growth rate was then multiplied by the 2023 population at the county level to distribute each area's share of growth. In a final step, we ensured the sum of all local area populations equals the total county population. This was done by subtracting the sum of all local areas from the county forecast population, with any remainder redistributed to localities based on their share of county population in that year.

The household forecast was estimated using the county-level forecast as well as data from the Census. The Census data used was the population in households (Table DP02), total households (Table S1101), and the average household size (Table DP02) from the 2018-2022 ACS. As the entire population does not live in a home, we took the percent of people living in a home for each area and applied this percent to the projected population in the area. This estimate of the number of people living in a home for each area was divided by the average household size. The difference between local area totals and the county forecast was calculated, with any remainder distributed to local areas based on their share of the county total in that year.

Local Area Employment: Methodology for initial forecast

The employment forecast was calculated by using Census Longitudinal Origin-Destination Employment Statistics (LODES) employment data. The employment forecasts were calculated for each geographic area within San Joaquin County by taking the annual growth rates from 2013 to 2021 (most current year available) LODES data. The average growth rate from 2013 to 2018 for each industry was calculated for each area but, due to volatility in the local data, we restricted the observations to exclude years with abnormally high and low rates by including only growth rates that are within one standard deviation of the unrestricted 2013 to 2021 growth average in each area. This process then used the county-level employment by industry forecast (presented in Section One above) to obtain the local forecast. This was done by taking the annual change in county-level employment by industry, applying the local restricted average growth rates by industry for all local areas, and then multiplying the individual rates by the sum of the annual change in employment by industry at the county level and the previous year's employment numbers.

$$Employment_{ijt+1} = Employment_{ijt} + (\overline{Restricted\ Growth\ Share_{ij}}) / Employment_{Ijt} - Employment_{Ijt-1}$$

Where:

$$Employment_{ijt} = \text{Employment in Geography}(j), \text{ for Industry } (i), \text{ at Year } (t)$$

$$Employment_{Ijt} = \text{Employment in San Joaquin County } (I) \text{ for Industry } (j) \text{ at Year } (t)$$

⁷ Data from the 2010 Decennial Census is taken from Summary File 1, Table P1 while data from the 2020 Decennial Census is taken from Demographic Profile, Table DP1.

$$\frac{\text{Restricted Growth Share}}{SD_{ij} \text{ of Unrestricted Growth Share}} = \frac{1}{k} \sum_{k=2050}^{2023} (\text{Employment Growth Rate}_{ij}) \text{ if Annual Growth Rate}_t \pm$$

Where: t = 2023-2050.

Due to rounding, the local areas do not sum to the county totals. To account for this, the sum of the local area's employment by industry was subtracted from the county-level figure and any remainders are distributed to local areas proportionally based on their industry share for that particular year.

Local Area Feedback Meetings and Forecast Adjustments

After the initial step of data gathering and generation of the initial forecast was completed, the preliminary results were distributed to local planning officials, and they were consulted in the second step to obtain local agency feedback and additional information on recent developments, future plans, and local market trends. The forecast was presented in a series of nine meetings beginning October 28th and concluding November 15th. These meetings occurred with key staff from all eight of the county's incorporated cities and San Joaquin County for the unincorporated portions.

On the topic of the geographic pattern of employment growth, there was general agreement around the county-wide adjustments made to the model and the distribution of employment activity across the county. In terms of the geography of population growth, there was also general agreement around the initial sub-county allocations. However, based on the conversations with the jurisdictions, additional attention to acreage available for residential development and growth dynamics were highlighted as an important consideration. Given the model's focus on previous rates, differences between the available acreage for future development and the initial sub-county population forecasts were reviewed as well as recent population estimates from the CA DOF.

Table 5 – Local Area Population Adjustments

City	Initial 2025-2050 Population Growth Rate	Adjusted 2025-2050 Population Growth Rate
Escalon City	16.5%	16.5%
Lathrop City	27.3%	90.9%
Lodi City	17.0%	17.0%
Manteca City	20.8%	20.8%
Mountain House CDP	40.9%	62.0%
Ripon City	18.1%	18.1%
Stockton City	17.7%	8.8%
Tracy City	18.2%	18.2%
Unincorporated East	15.7%	12.4%
Unincorporated Northwest	16.5%	13.1%
Unincorporated Southwest	17.6%	14.2%
(Sub-Total Unincorporated)	16.6%	13.2%
County Total	18.9%	18.9%

This review resulted in an upward adjustment in the growth rates of the cities of Lathrop and Mountain House as well as a reduction in the City of Stockton's growth rate. Given the county-level forecast functioning as the control for the sub-county entities, meaning the sum of the sub-county jurisdictions must equal the county total, the Unincorporated regions were given proportional reductions in their population growth. Table 6 summarizes the impact of these adjustments on the 2025 to 2050 population growth rates.

2.3 – Local Area Population Forecasts

Tables 6 to 12 summarize the results of the local forecasts by area. The appendix provides further details of the local employment forecast by industry.

As shown in Tables 6 and 7, Lathrop and Stockton together are projected to gain about 25,000 new residents over the next decade, and a total of nearly 63,000 new residents between 2025 and 2050. The southwestern portion of the county is forecast to remain a strong source of population growth with Lathrop, Mountain House, Manteca, and Tracy leading the county's growth rates.

Table 6 – Local Area Population Forecast

Location	2025	2030	2035	2040	2045	2050

<i>(Sub-Total Unincorporated)</i>	<u>8,471</u>	<u>6.4%</u>	<u>17,348</u>	<u>13.2%</u>
Total San Joaquin County	63,266	7.9%	152,092	18.9%

Tables 8 and 9 project the growth in households by local area. As expected, household growth parallels the findings for population growth with relatively minor difference with population dynamics because of demographic differences in the local areas. Lathrop and Stockton together are projected to add over 7,000 households over the next decade and 17,600 households through 2050. The southwest of the county is again projected to have the highest growth rates, with Lathrop, Mountain House, Manteca and Tracy experiencing the fastest rates of growth.

Tables 10 and 11 summarize projected employment growth. In the next decade the rate of employment growth is projected to exceed that of population and households. While slowing from recent rates, transportation and warehousing will contribute to Tracy having the highest employment growth rate. Stockton will add the most jobs in total with growth slightly above the county-wide rate. Together Stockton and Tracy will account for over three-fifths of job growth across the 2025-2050 forecast horizon.
